

MAKING YOUR SELECTION

Each of our pre-hung external door products (timber and composite) is supplied with a lock capable of **night latch** operation or **standard operation**. Below we show you how to select between the 2 functions.

Option 1

The '**Solid Square Spindle**' offers '*standard locking*' functionality.

If you fit this between the inner and outer handle, the latch mechanism can be operated from both sides of the door.

The drawback to this is that entry can be gained to the property without the use of a key unless you actually lock the door.

The benefit is that you will not lock yourself out by accident.

Option 2

The '**Split Spindle**' offers '*night latch*' functionality.

If you fit this between the inner and outer handle, the latch is operated from inside handle only and the key must be used from outside to gain entry.

The drawback to this is that if the door closes behind you and you do not have your key, you can become locked out.

The benefit is that if you enter the property and close the door behind you, a sneak thief would find it much harder to gain entry.

Night latch operation DOES NOT provide full security. The door should be secured in the normal method using your key to in the usual method when leaving the property or in other situations when you wish to fully lock the door.
